PDP Layout — Nexvo Defaults vs. MDM Customisations

MDM SHOPIFY THEME · PRODUCT DETAIL PAGE · 18 SEPTEMBER 2026

The product detail page shipped with a page grid of its own: custom gutters in the theme CSS, plus additional Custom CSS entered through the theme editor. As a result the product content only lined up with the breadcrumbs at a few specific window widths — by coincidence, not by design. All custom horizontal spacing has now been removed, so the PDP uses the theme's own page grid. Breadcrumbs and product content share the same left edge at every window width.

1 Measured alignment, before and after

Distance of the first breadcrumb and of the product title from the left window edge, in CSS pixels. Measured in headless Chrome via `getBoundingClientRect()`.

Window width	Breadcrumbs before	Product before	Offset before	Breadcrumbs after	Product after	Offset after
375 px (phone)	16	16	0	16	16	0
767 px (phone, large)	16	16	0	16	16	0
1000 px (tablet)	16	100	84	16	16	0
1280 px (laptop)	100	100	0	50	50	0
1440 px (laptop, large)	100	100	0	50	50	0
1636 px (desktop)	185	191	6	135	135	0
1920 px (desktop, large)	185	333	148	135	135	0

The old layout matched at 1280 px and 1440 px and was 6 px off at 1636 px, which is why it looked correct on many screens. At 1000 px it was 84 px off and at 1920 px 148 px off. Every value in the two "after" columns equals the theme gutter, so the page now scales with the theme instead of against it.

2 The theme's page grid (Nexvo default)

One variable, `--page-padding`, defines the side margin for every section of the shop.

Window width	Side margin	Defined in
up to 1199 px	16 px (`1.6rem`)	`theme.css :173`
1200 – 1535 px	50 px (`5rem`)	`theme.css :193`
1536 px and above	`max(135px, 50vw - 850px)`	`theme.css :208`

Above 1536 px the formula keeps the content centred and caps it at the theme's maximum content width of 1700 px, which is a merchant setting (`page_width`). The breadcrumbs have always followed this grid; the product section now does too.

3 Element by element: what is Nexvo, what was custom

Origin of every rule that influenced the horizontal position of PDP content. **Nexvo** theme default **MDM CSS** MDM copy of the section stylesheet **Theme editor** Custom CSS stored in the template

Element	Rule	Origin	Source	Status
Breadcrumbs				
Section container	`padding-inline: var(--page-padding)`	Nexvo	`theme.css :159`	unchanged
Section container	`.page-width--fixed`	MDM CSS	`mdm-collection-layout.css :2`	no effect on PDP

Element	Rule	Origin	Source	Status
Breadcrumb list	`padding-inline: 5rem` (from 1280 px)	Theme editor	`product*.json`	removed
Breadcrumb list	Typography only: gap, font size, letter spacing, uppercase	MDM CSS	`mdm-section-breadcrumbs.css`	unchanged
Product section				
Section container	`padding-inline: var(--page-padding)`	Nexvo	`theme.css :159`	now active
Section container	`padding-inline: 0 !important`	MDM CSS	`mdm-section-main-product.css`	removed
Section container	`max-width: 1440px; margin-inline: auto`	MDM CSS	`mdm-section-main-product.css`	removed
Product block	`padding-inline: 100px !important`	MDM CSS	`mdm-section-main-product.css`	removed
Product block	`padding-inline: 10rem` (from 1280 px)	Theme editor	`product*.json`	removed
Text column (below 768 px)	`padding: 24px 16px 0 !important`	MDM CSS	`mdm-section-main-product.css :1736`	side padding dropped, 24 px top kept
Text column (below 768 px)	`padding-inline: 1.6rem`	Theme editor	`product*.json`	removed (duplicate)
Spacing tokens	`--mdm-layout-pad-*` (6 variables)	MDM CSS	`mdm-section-main-product.css`	removed (unused)

4 Vertical spacing

Space above and below the product block, measured on the same page.

Window width	Top before	Bottom before	Top after	Bottom after	Comment
below 768 px	0 px	36 px	0 px	36 px	unchanged
768 px and above	20 px	120 px	0 px	60 px	section setting is now the only source

The old values were the sum of two paddings: the section spacing set in the theme editor (0 px top, 60 px bottom) plus a second padding on the inner product block (20 px / 60 px). Only the section setting remains, so the spacing can now be adjusted in the theme editor as with every other section. The 24 px gap above the text column on phones was kept.

5 Still custom, left untouched

These deviations from the theme default were not part of the alignment fix and are still in place.

What	Value	Origin	Nexvo default
Image column width (from 1024 px)	`max 605 px, fixed`	MDM CSS	scales as a percentage
Text column width (from 1024 px)	`max 585 px, fixed`	MDM CSS	derived from image column
Column ratio / gap	`--media-width: 48.4%, gap 3rem`	Theme editor	theme setting
Gap between image and text	`padding-inline-start: 0 !important`	MDM CSS	`2rem`
Top gap above text column (phones)	`24 px`	MDM CSS	none
Breadcrumb typography	12 px, uppercase, letter spacing	MDM CSS	body text
Tab content width	`max-width: 52rem`	Theme editor	full width

6 Three points for design review

> **A · Side margin on phones is now 16 px**
>
> The text block used to sit 32 px from the edge, because the section had no margin of its own and the text column added 16 px on top of the theme's 16 px. Both paddings now come from one source, so the block sits 16 px from the edge — the theme default, but noticeably tighter than before. If a wider margin is wanted on phones, it should be set once for the whole shop rather than for this section alone.

> **B · Wide screens: the content area is no longer capped at 1440 px**
>
> The product section used to stop at 1440 px and centre itself, while breadcrumbs, tabs and all other sections ran to the theme's 1700 px. That mismatch caused the misalignment at 1920 px. The section now follows the theme. Open question: the image and text columns are still capped at 605 px and 585 px and are spread apart by `space-between`, so on a 1920 px screen roughly 460 px of empty space opens up between image and text. Either the columns should scale with the container, or the content area needs a deliberate maximum width — this is a design decision.

> **C · Product images could not be checked**
>
> Every product in the development store currently renders without images, so the two-column layout could only be verified by calculation, not visually. Point B should be reviewed once images are back — ideally on the staging theme.

7 What was changed, and how it was verified

Four files, all in the MDM theme repository. No theme core file was touched.

File	Change

File	Change
`assets/mdm-section-main-product.css`	Removed the section's own gutter, vertical padding, the 1440 px width cap and six unused spacing variables; released the side padding of the text column on phones. 23 lines removed, 1 changed.

`templates/product.json`
`templates/product.mdm.json`
`templates/product.kollektion.json`
	Removed three Custom CSS rules per template: the 5rem breadcrumb padding, the 10rem product padding and the duplicated 1.6rem text-column padding. All other Custom CSS was left in place.

Verification.

Check	Result
Measurement	Headless Chrome, seven window widths from 375 px to 1920 px, element edges read via `getBoundingClientRect()`. Offset is 0 px at every width.
Theme linter	`shopify theme check`: 37 errors, 22 warnings — identical to the baseline before the change. All of them pre-existing (missing Spanish translations, generated blocks).
Template syntax	All three product templates parsed as valid JSON after editing.
Not verified	Visual check of the two-column layout with product images (see point C).

> **One note for whoever edits the theme editor next**
>
> Three of the removed rules were stored in the section's *Custom CSS* field in the theme editor, not in the codebase. If they are entered there again, the misalignment comes back and the change is overwritten. Worth agreeing on before the next round of editor work.

MDM Shopify theme · product detail page · figures measured on the local development server, 18 September 2026. Theme base: FoxEcom bundle imported on 8 May 2026; its settings declare Hyper 1.3.3.
