PDP Tabs — Aligned to the Page Grid

Four changes to the tab area, what went back to the theme default, and five things I need you to decide

21 September 2026 · MDM Shopify theme · Konrad Thiemann

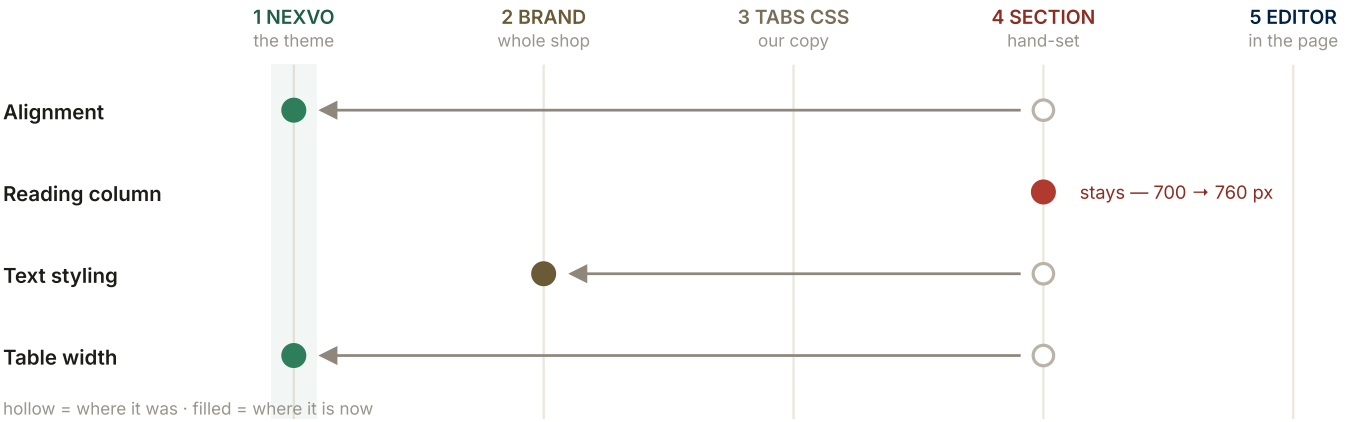

Three days ago we straightened the product block on the detail page so it lines up with the breadcrumbs. The tab area below it still had a page grid of its own, so the same misalignment was still there — just lower down the page. That is now fixed, along with three other things you asked for. One of them changes how text looks, and that is the part I would like you to look at first.

1. The four changes

Anything we change in a theme sits on one of five layers, from the theme's own behaviour at the top to a rule typed into the theme editor at the bottom. The further up a change sits, the less of it is ours to maintain. Section 6 explains the layers in full; the last column here is the short answer for each change.

The five layers: 1 NEXVO · 2 BRAND · 3 TABS CSS · 4 SECTION · 5 EDITOR

What	Before	After	Now lives on
Alignment	The tab area had its own margins and stopped at 1440 px	Follows the theme page grid — same left edge as the breadcrumbs at every width	1 NEXVO was layer 4
Reading column	700 px	**760 px**	4 SECTION stays — ours
Text styling	Sizes, line height and colour written into this one section	Comes from the shop-wide rich-text rules, like every other page	2 BRAND was layer 4
Technical data table	Stopped at 1280 px	Full width — the theme default	1 NEXVO was layer 4

All four started as hand-set rules in this one section. Three of them moved up to a layer we no longer have to maintain — two to the theme itself, one to the shop-wide brand stylesheet. Only the reading column is still a deliberate exception, and it is the one you asked for.

2. Alignment, measured

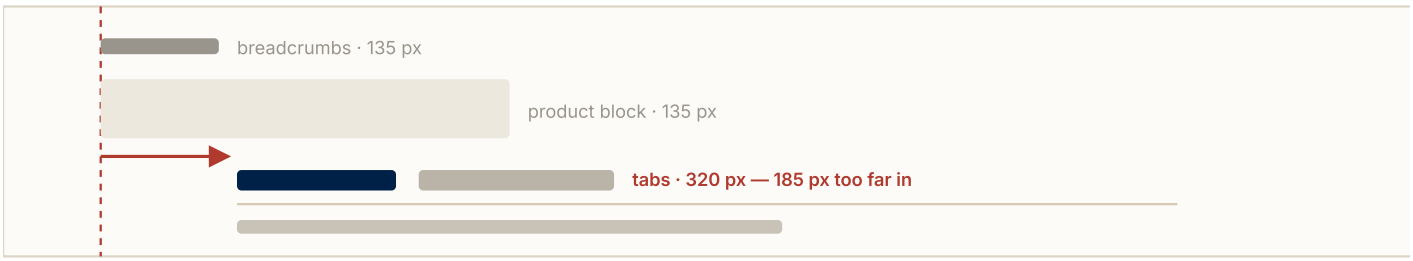

> **NOW ON LAYER 1 · NEXVO** the theme's own page grid — no rule of ours involved any more

Distance of the first breadcrumb and of the first tab label from the left window edge, in CSS pixels. Measured in headless Chrome via `getBoundingClientRect()`, on the same page, before and after the change.

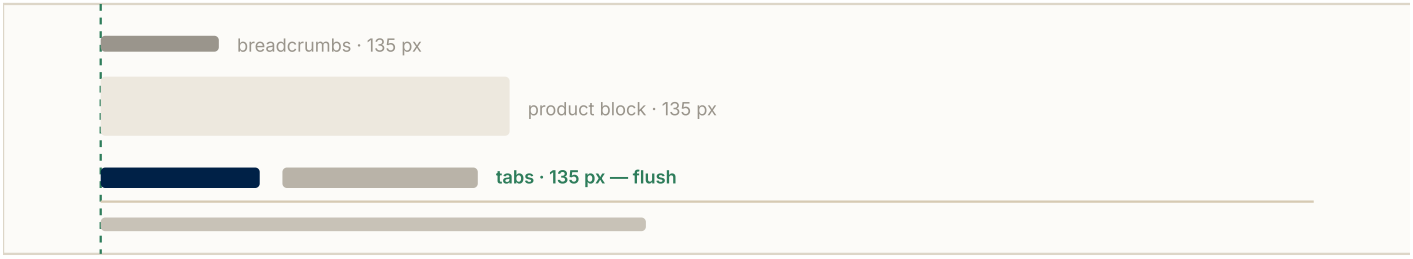

Window width	Breadcrumb	Tabs before	Offset before	Tabs after	Offset after
375 px · phone	16	16	0	16	0
767 px · phone, large	16	16	0	16	0
1000 px · tablet	16	80	64	16	0
1280 px · laptop	50	80	30	50	0
1440 px · laptop, large	50	80	30	50	0
1636 px · desktop	135	178	43	135	0
1920 px · desktop, large	135	320	185	135	0

The tab area was off at every width above 767 px, and worst on large screens: 185 px at 1920 px. Every value in the last column is now the theme gutter, so the page scales with the theme instead of against it.

BEFORE — window 1920 px

AFTER — window 1920 px

Schematic, drawn to scale from the measured values. The dashed line is the left edge of the breadcrumbs. Note that the rule under the tab labels also starts and ends with the grid now, instead of floating inside it.

3. The reading column: 700 → 760 px

> STAYS ON LAYER 4 · SECTION hand-set in this section — a deliberate exception, the only one left

The description and the free-extras tab are held to a fixed reading width so the lines do not run the full width of a large screen. That column is now **760 px** instead of 700 px, as you asked. It takes effect from 1280 px upward; below that the window is narrower than the column anyway, so nothing changes on phones and tablets.

The technical data table is deliberately *not* inside this column — see section 5.

4. Text styling — the change you will notice

> NOW ON LAYER 2 · BRAND our shop-wide rich-text stylesheet — shared with every other page

This section used to carry its own type scale, written directly into it. That is now gone, so the text in the tabs is styled by the same shop-wide rich-text rules that already style the help pages, the policy pages and every other body copy in the shop.

On desktop the body copy is practically unchanged. The headings inside the description are not — they used to render as a small uppercase eyebrow line, and now render as a real heading.

Element	Before	After
Body copy desktop	Inter 16 px · line height 26.4 px · #615B4F	Inter 16 px · line height 27.2 px · #3E3A32
Body copy phone	Inter **14 px** · line height 21 px	Inter **16 px** · line height 27.2 px
Heading in the copy desktop	Inter 16 px · semibold · **UPPERCASE** · letter spacing 1.68 px · #615B4F	EB Garamond **32 px** · medium · sentence case · #002147
Heading in the copy phone	Inter 11 px · semibold · **UPPERCASE** · letter spacing 1.54 px	EB Garamond **32 px** · medium · sentence case
Paragraph spacing	24 px between every element	16 px after a paragraph, 32 px before a heading

> **Worth knowing: "theme default" here means two different things**
>
> The page grid went back to the **theme's own** stylesheet — that is a true restoration of the Nexvo default.
>
> The typography went back to **our brand layer**, the file that sits on top of the theme and carries the MDM type scale and colours. That is still our own design, just defined once for the whole shop instead of separately inside this one section. Nexvo untouched would look different again.

5. The technical data table

WIDTH NOW ON LAYER 1 · NEXVO no width rule at all; the table itself stays ours — layer 4 markup, see section 6

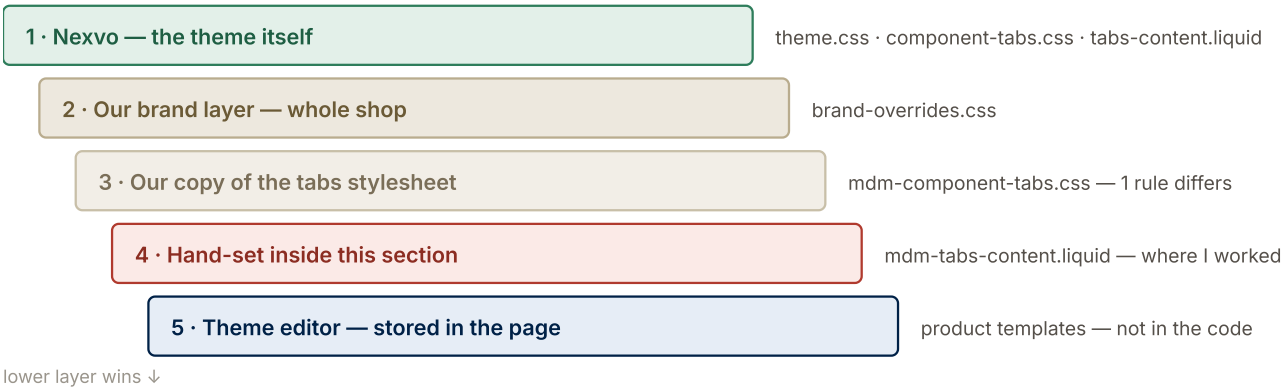

You asked what the theme default is here. It is **full width** — the theme puts no limit on it. The table was never limited itself; it was simply boxed in by the 1440 px cap on the section around it. With that gone, it now uses the full content width.

Window width	Table before	Table after
1000 px	840 px	968 px
1280 px	1120 px	1180 px
1440 px	1280 px	1340 px
1636 px	1280 px	1366 px
1920 px	1280 px	**1650 px**

1650 px is where the theme's own maximum content width lands on a 1920 px screen. It is a merchant setting, currently 1700 px, and it applies to every section of the shop.

6. Where every rule comes from

You asked for this and it is the most useful page in the document: for every part of the tab area, whether it is the theme's own behaviour or something we added, and if we added it, from which of our layers. Five layers stack on top of each other, and the lower one always wins.

Layer 5 is the one worth remembering: rules typed into the Custom CSS field of the theme editor beat everything in the codebase, and they are invisible to anyone reading the code.

NEXVO theme default, untouched BRAND our shop-wide CSS TABS CSS our copy of the tabs stylesheet SECTION hand-set in this section SNIPPET our own component, no Nexvo equivalent EDITOR typed into the theme editor

Element	Rule	Where it comes from	Status
The section frame			
Section wrapper and its classes	markup, `page-width`	NEXVO	unchanged
Side margin	`padding-inline: var(--page-padding)`	NEXVO	now active
Its own side margin	`clamp(2rem, 5.56vw, 8rem)`, then `8rem` flat	SECTION	removed
Width cap	`max-width: 1440px`	SECTION	removed
Container width “fixed”	a setting, not a rule	EDITOR	unchanged
Space above the section	60 px	EDITOR	unchanged
Space below the section	60 px, hand-set — see the box below	SECTION	unchanged
The tab bar			
Tab buttons, switching, keyboard use	markup and behaviour	NEXVO	unchanged
Tab labels are EB Garamond	Nexvo puts them on the heading font	NEXVO	unchanged
Tab label size, weight, colour	24 px · 400 · #615B4F, active #002147	SECTION	unchanged
Space between labels	48 px — Nexvo has 60 px	SECTION	unchanged
Space between labels, phone	24 px — *identical to Nexvo*	SECTION	redundant
Rule under the tabs	#D6CAB3 — Nexvo uses 20 % of the text colour	SECTION	unchanged
Active tab indicator	#002147	SECTION	unchanged
Tabs start at the left on phones	Nexvo centres them	TABS CSS	unchanged
The tab content			
Content wrapper	`page__content rte text-subtext`	NEXVO	unchanged
Reading column	`max-width` 700 → **760 px**	SECTION	changed
Body copy type	Inter 16 px · 1.7 · #3E3A32	BRAND	now active
Headings in the copy	EB Garamond 32 px · #002147	BRAND	now active
Its own type scale	sizes, line height, colour, spacing — desktop and phone	SECTION	removed

Element	Rule	Where it comes from	Status
Space above the panel, gap	40 px · 16 px — 24 px · 10 px on phones	SECTION	unchanged
Where the text comes from	Nexvo: text typed per tab. Ours: the product description and product fields	SECTION	unchanged
The technical data tab			
The tab type itself	Nexvo has no such tab — we added it	SECTION	unchanged
Table markup and styling	rows, rules, labels, group headings	SNIPPET	unchanged
Two columns, 80 px apart	`1fr 1fr`, one column on phones	SNIPPET	unchanged
Table width	no rule at all — it takes what the section gives it	NEXVO	now full width
Left in the theme editor			
Image-with-text width	`max-width: 52rem` — see section 10	EDITOR	inert

Read down the “where it comes from” column and the picture is this: the tab area is mostly Nexvo underneath, with roughly a dozen hand-set rules on top. Eleven of those left with this change, one was adjusted to your 760 px, and what remains is brand styling — colours, type sizes and spacing — rather than layout.

> **One override you should know about: the bottom spacing**
>
> The theme editor has a control for the space below this section, and it is set to **0 px**. The section ignores it: a hand-set `60 px` in the code wins, and I measured 60 px on the page. So turning that dial in the editor does nothing.
>
> I left it as it is, because removing it would collapse the gap to the section below and that is a spacing decision, not a cleanup. But it is exactly the kind of thing that makes the editor feel broken — see D5.

7. Five decisions for you

D1 The headings inside the description

This is the real question in this document. Those lines used to be a small uppercase eyebrow — a deliberate choice from the Figma file, noted in the code. Letting the theme settings drive the text means that choice goes away and they become EB Garamond 32 px in navy, like headings everywhere else in the shop. Both are defensible. If you want the eyebrow back, it comes back as a section-level exception, and we should write down why — otherwise it is exactly the kind of override that is invisible later.

D2 That heading is 32 px on phones too

The shop-wide rule has no separate phone size for this heading level, so a 375 px screen gets a 32 px heading. It was 11 px before. If that is too large, the fix belongs in the shop-wide type scale rather than in this section — it would fix the help pages at the same time.

D3 Body copy on phones grew from 14 to 16 px

A direct consequence of dropping the section's own sizes. 16 px is the shop-wide body size and, for what it is worth, the friendlier of the two to read. Just confirming you are happy with it, because it is a visible change on every product page.

D4 Wide screens: the table rules now run long

Each of the two table columns is 785 px wide at 1920 px, but the widest row only uses 326 px of it. So the hairline under each row carries 459 px of empty space — it was 274 px before, so the change made an existing effect more visible. Either the two columns should not grow past a sensible maximum, or the rules should stop where the text stops. This is a design call, not a bug.

D5 Should the bottom spacing go back to the editor?

The box in section 6: the space below this section is hand-set to 60 px in the code and the editor control for it is dead. I can release it, and then the value you set in the editor is the value on the page — but the current 0 px in the editor would make the gap collapse, so we would need to put 60 px in first. Small job, your call whether it is worth doing now or with the next round of spacing work.

8. One observation outside the layout

On the test product several rows in the technical data table have no label at all — "Silber (900/1000)", "10000", "2026" and "50.00" sit there on their own. That is product data, not layout: the label fields on the product are empty. Flagging it because it will show up in any screenshot you take of this tab, and it is not something the theme can fix.

9. How this was checked

Check	Result
Measurement	Headless Chrome, seven window widths from 375 px to 1920 px, element edges read via `getBoundingClientRect()`. Offset is 0 px at every width.
Theme linter	`shopify theme check`: 37 errors, 23 warnings — identical with and without the change on the same commit. All pre-existing.
Liquid validation	Passed Shopify's theme check for the edited file.
Scope	One file, style rules only. No markup, no settings, no template changed. No theme core file touched.

> *"But if you override everything, then we won't know later what has to be removed." — the same principle as on the collection card. Eleven hand-set rules left this section; one stayed, and it is the one you asked for.*

10. Still open in the theme editor

One rule is still stored in the section's Custom CSS field in the theme editor, not in the code: `.image-with-text__content { max-width: 52rem }`. It has no effect on the tabs as they are built today, because the block it targets is not in use. It would take effect the moment someone adds an image-with-text block to this section. Say the word and I take it out while we are in here.

MDM coin shop · Shopify theme (Hyper 1.3.3) · Product detail page, tabs section · Figures measured on the local development server, 21 September 2026 · Follow-up to "PDP Layout — Nexvo Defaults vs. MDM Customisations", 18 September 2026
