

PLP Card — Back to the Nexvo Default

What Latori overrode, what we keep, and what we need to decide together

15 September 2026 · Prepared for the 13:00 session · Konrad Thiemann

You were right. I went through the code after our call, and the product card on the collection page is not an override of the Nexvo card — it is a complete rebuild that happens to look similar. Not one Nexvo feature survives in it. This document lists every deviation so we can work through them point by point.

1. What I found

The file `snippets/mdm-card-product.liquid` was created on 29 July 2026 with the commit message “duplicate mdm snippets”. It was then edited away from the original until nothing of the original logic was left. Here is the full inventory:

Nexvo feature	Original card	PLP card today
Second image on hover (coin reverse)	yes	gone
Quick-view button	yes	gone
Quick-add / cart button	yes	gone
Compare checkbox	yes	gone
Badges (sold out, sale)	yes	gone
Flash sale	yes	gone
Colour swatches	yes	gone
Price rendered by the shared price component	yes	own markup
Title line limit setting	yes	gone
Content alignment setting	yes	gone
Image ratio setting	yes	hardcoded to 240/190
Card style / colour scheme setting	yes	gone
Zoom animation on the image	yes	gone

2. Why the theme editor does nothing

This is the part that matters most for you. The settings are still there and still switched on — the card simply never reads them.

Theme editor settings

switched on, saved, live

Show second image on hover	ON	-----X
Quick-view button	ON	-----X
Image ratio	adapt	-----X
Title line limit	none	-----X
Content alignment	left	-----X
Card style	card	-----X
Badges, flash sale, swatches	ON	-----X

the card never reads them

What renders

the PLP card

Hardcoded in the copy
image ratio, German labels, thumbnails, badge text

Every setting on the left is active in the theme editor and has no effect on the collection page. The only values that reach the card are the ones written directly into Latori's copy — which is exactly why changing a setting appears to do nothing.

One collision to resolve before we restore the hover

Nexvo uses the **second product image** for the hover reverse — the effect you said should stay. Latori uses **the same images** (images 2 to 4) for the round “Weitere Ausgaben” thumbnails.

So if we switch the hover back on and leave the thumbnails as they are, the second image will appear twice: once as the hover reverse, once as the first thumbnail. We need to decide which one wins — see C2.

3. Point-by-point classification

Every deviation I found, sorted into three buckets. **KEEP** is what you confirmed we ordered. **RESTORE** goes back to the Nexvo default. **DECIDE** needs the two of us.

Bucket	Item
KEEP	"inkl. gesetzl. MwSt." line — does not exist in Nexvo
KEEP	30-day lowest price line (EU Omnibus) — does not exist in Nexvo
KEEP	Spacing between title, product text and price
KEEP	Brand typography and brand colours on the card
KEEP	Tile lift and shadow on hover
RESTORE	Second image on hover — the coin reverse
RESTORE	Image ratio driven by the setting instead of hardcoded
RESTORE	Title line limit, content alignment, card style settings
RESTORE	Badges and flash sale via the Nexvo components
RESTORE	Price rendered by the shared price component
RESTORE	Quick-view, quick-add and compare wired back to their settings
RESTORE	German text moved out of the code into the translation files
DECIDE	C1 – Whole tile clickable
DECIDE	C2 – "Weitere Ausgaben" thumbnails and the image collision
DECIDE	C3 – "KOLLEKTION · Classic / Flatrate / Set" badge
DECIDE	C4 – Two different implementations of the 30-day price
DECIDE	C5 – How far the restore should go

4. The five decisions — our agenda

C1 Whole tile clickable

This was the request I started from before our call, so I want to put it to you honestly: **it is not a Nexvo default**. The original card also has only an image link and a title link. Making the whole tile clickable would be a deliberate addition on top of the default, not a restoration of it — which sits awkwardly next to "we don't want to override anything here". My suggestion: restore the default first, then look at the card again and decide whether it still needs it.

C2 The "Weitere Ausgaben" thumbnails

You said they are presentation only, with no function. Two questions. Do we take their links off and leave them decorative, or remove them altogether? And once the hover reverse is back, which of the two shows the second image — see the box above.

C3 The “KOLLEKTION · Classic / Flatrate / Set” badge

Latori invented this; it is not on the list of things we ordered and the labels are written straight into the code. Keep it, drop it, or rebuild it properly from product data?

C4 Two implementations of the 30-day price

The collection card reads the metafield directly; the compact card used elsewhere uses a shared component. Same legal line, two mechanisms. Which one is the right one?

C5 How far does the restore go?

Restoring the default brings back quick-view, quick-add and the compare checkbox. That is a visible change to the collection page. Confirm you want them, or we switch the individual ones off through the settings — which is the clean way, because then it stays visible in the editor rather than buried in code.

5. How we avoid overwriting each other

You work in the theme editor, I work in the code and open pull requests. Worth knowing: the store and the repository are synced in both directions, so **your theme editor changes do arrive in the code repository** as automatic commits — there are three from 7 September in the history already. They mostly touch the settings file.

That is good news: it means we are not on separate islands. It also means I need to pull your changes before I push mine. If we both touch the same thing, we look at it together and pick one, exactly as we said.

“But if you override everything, then we won’t know later what has to be removed.” — that is the principle this whole document is built on. Anything we change from here should go through a setting. Code only where no setting exists, and written down when it happens.

6. What I will have ready for 13:00

- This inventory, open on screen, so we can walk the list top to bottom.
- The current card and the untouched Nexvo card side by side, so you can see what the default actually looks like before we decide what to keep.
- A branch ready to take the changes, so nothing goes near the live shop until you have seen it.
